

The dream of an artificially intelligent entity is not new

Talos, an ancient mythical automaton with artificial intelligence

The dream of an artificially intelligent entity is not new

The image consists of a composite of three elements. At the top left is a screenshot of a ZEIT ONLINE website. The header 'ZEIT ONLINE' is visible, along with a navigation bar for 'Politik', 'Gesellschaft', 'Wirtschaft', 'Kultur', 'Wissen', 'Digital Campus', 'Arbeit', 'Entdecken', 'Sport', 'ZEITmagazin', 'Podcasts', and 'mehr'. A search bar and a 'Z+' button are also present. The main headline reads 'Gottfried Wilhelm Leibniz: Er wollte die Welt mit Intelligenz in den Griff bekommen'. Below the headline is a quote: '... die aber machte nicht mit. Was wir dennoch von Gottfried Wilhelm Leibniz lernen können - 300 Jahre nach dem Tod dieses letzten deutschen Universalgenies.' To the right of the screenshot is a black and white portrait of Gottfried Wilhelm Leibniz. The background of the entire image is a dark blue-grey color with a subtle pattern of interlocking gears.

Leibniz „philosophises about ‘artificial intelligence’ (AI). In order to prove the impossibility of thinking machines, Leibniz imagines of ‘a machine from whose structure certain thoughts, sensations, perceptions emerge“ — Gero von Radow, ZEIT 44/2016

**But, what
exactly is AI?**

Humans are considered to be smart

<https://www.youtube.com/watch?v=XQ79UUlOeWc>

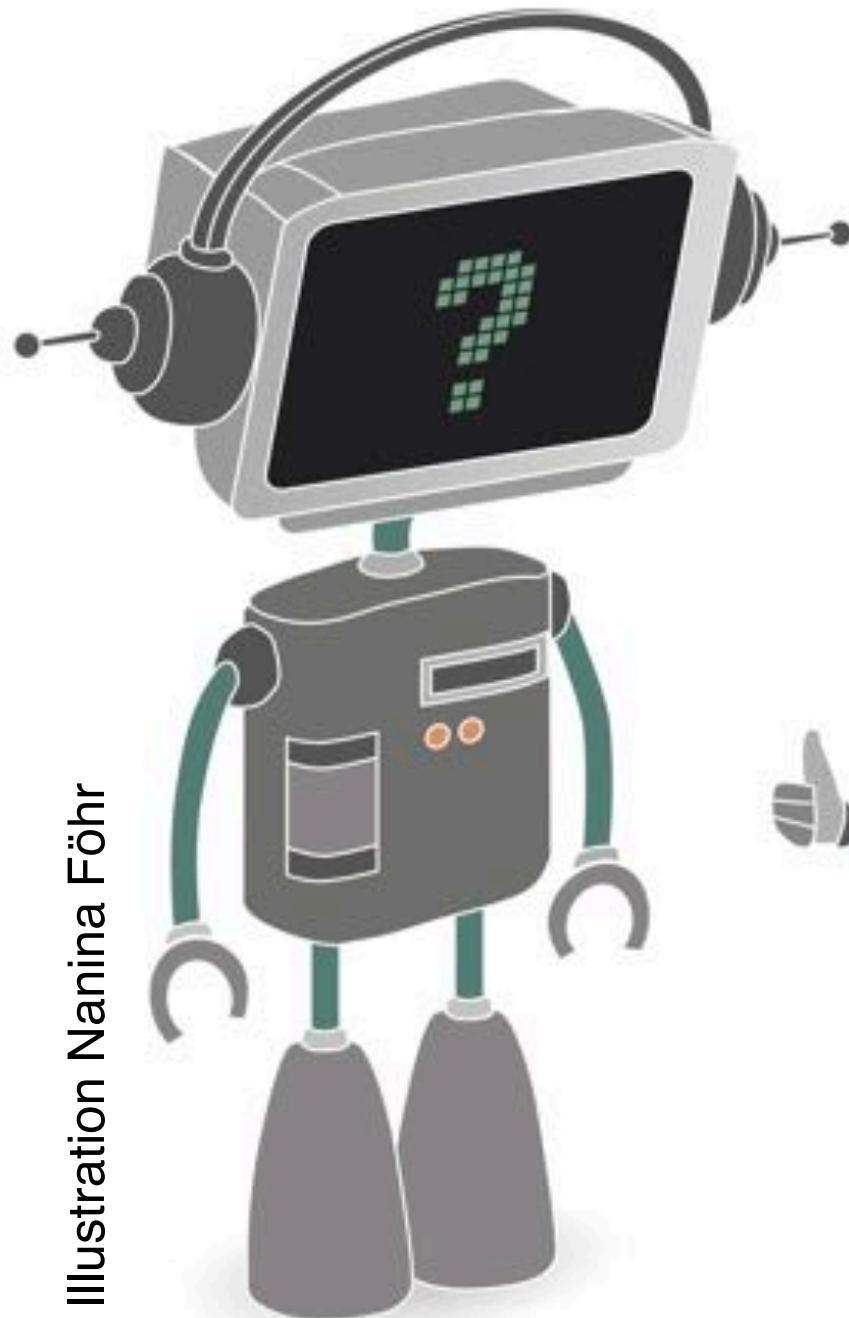

A photograph taken from inside a building, looking out through a dark wooden window frame. The window has multiple panes. The view outside is mostly bright white light from a cloudy sky, with some dark evergreen trees visible at the top left and bottom right. A small portion of a green landscape is visible at the bottom.

Are flies smart?

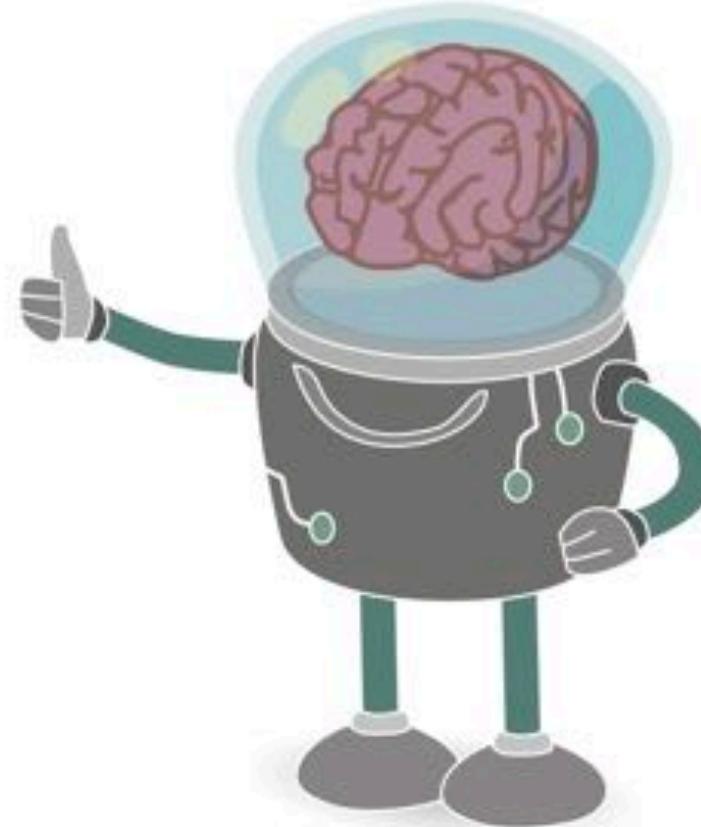

What about orangutans?

Illustration Nanina Föhr

Intelligence has
many qualities.

It is difficult to directly
capture/measure it.

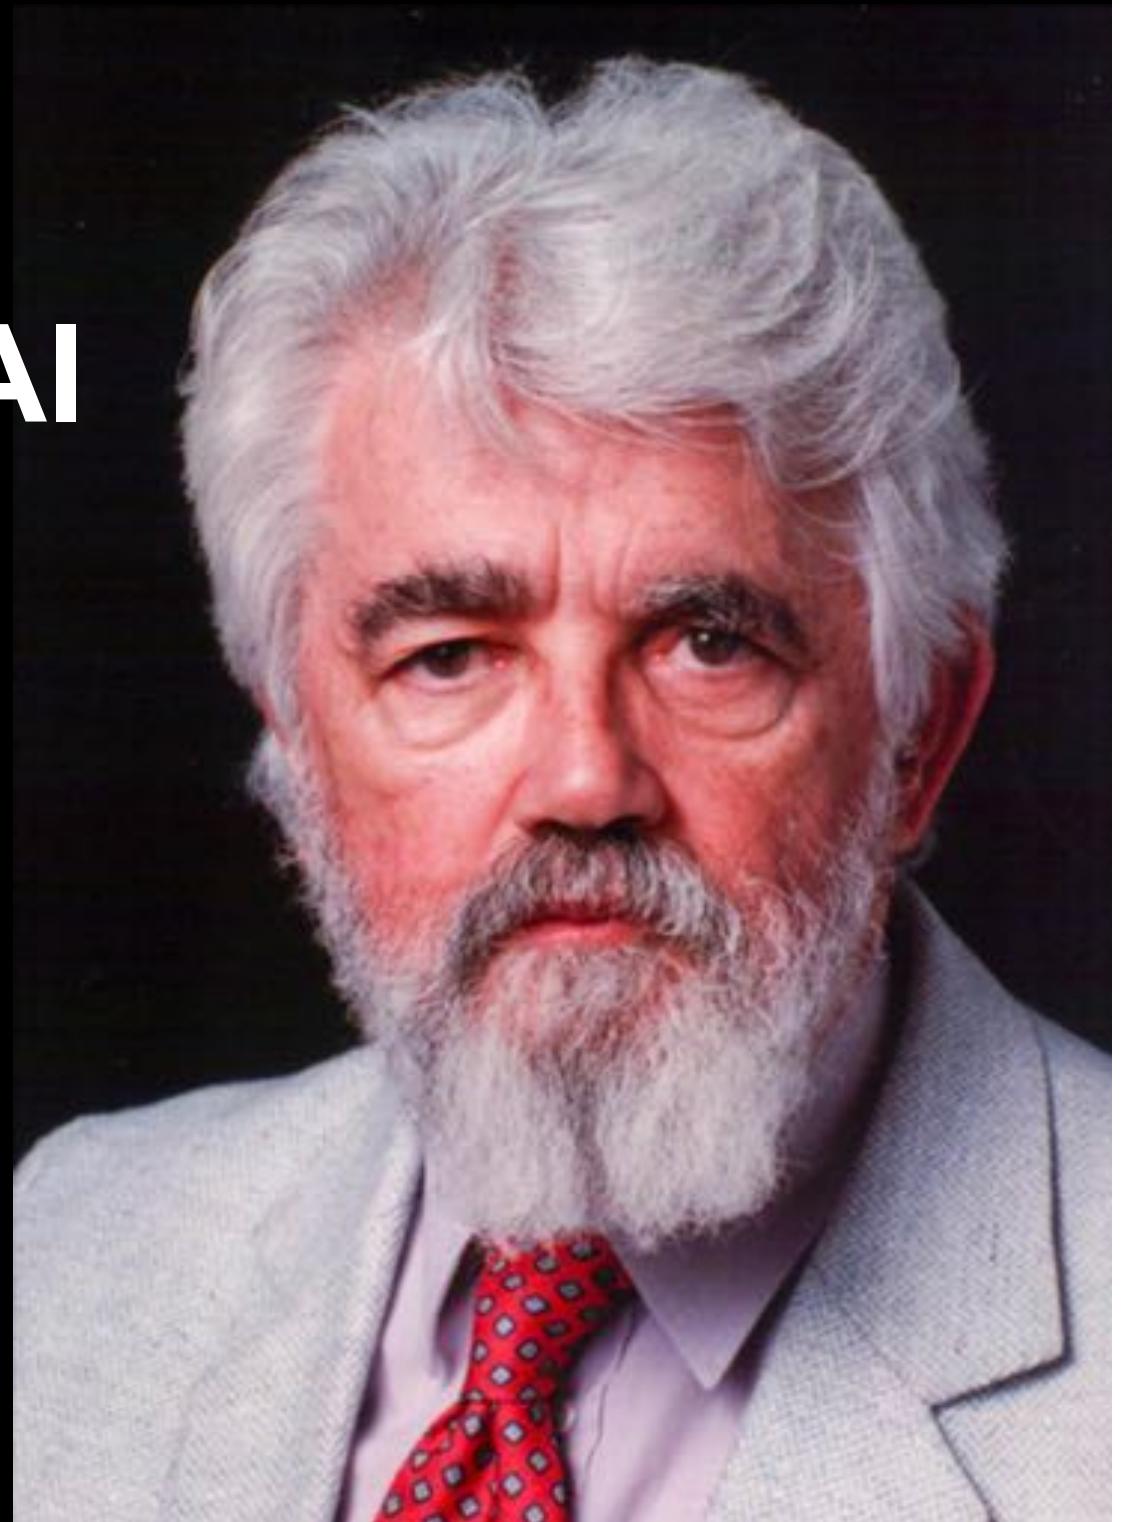

The Definition of AI

„the science and engineering of making intelligent machines, especially intelligent computer programs.

It is related to the similar task of using computers to understand human intelligence, but AI does not have to confine itself to methods that are biologically observable.“

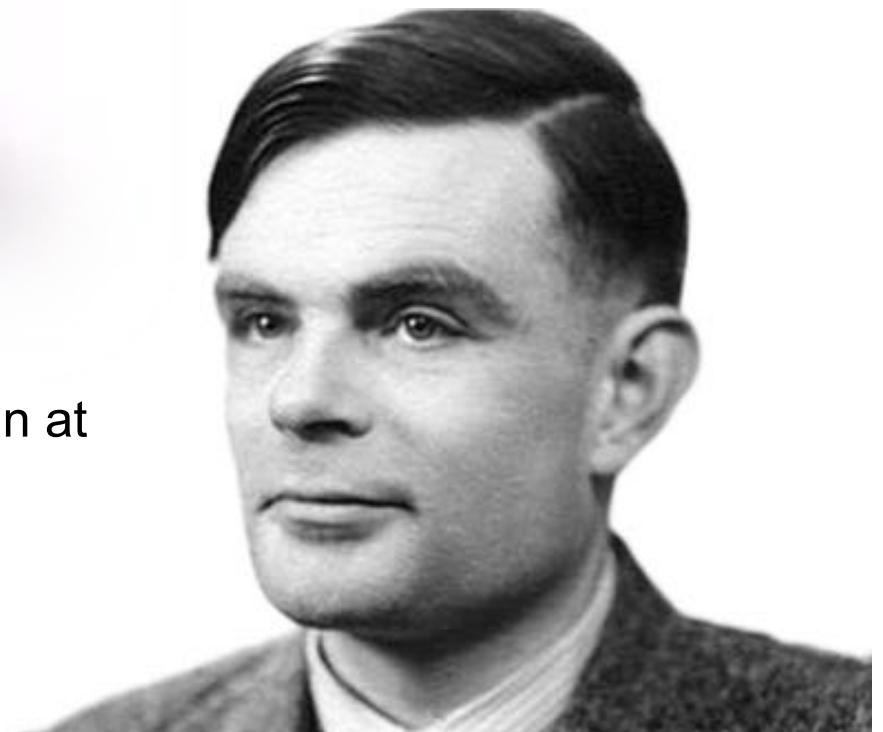

- John McCarthy, Stanford (1956), coined the term AI, Turing Awardee

Turing Award = Nobel Prize for Computing

Named after Alan Turing, a British mathematician at the University of Manchester. Turing is often credited as being the key founder of theoretical computer science and AI.

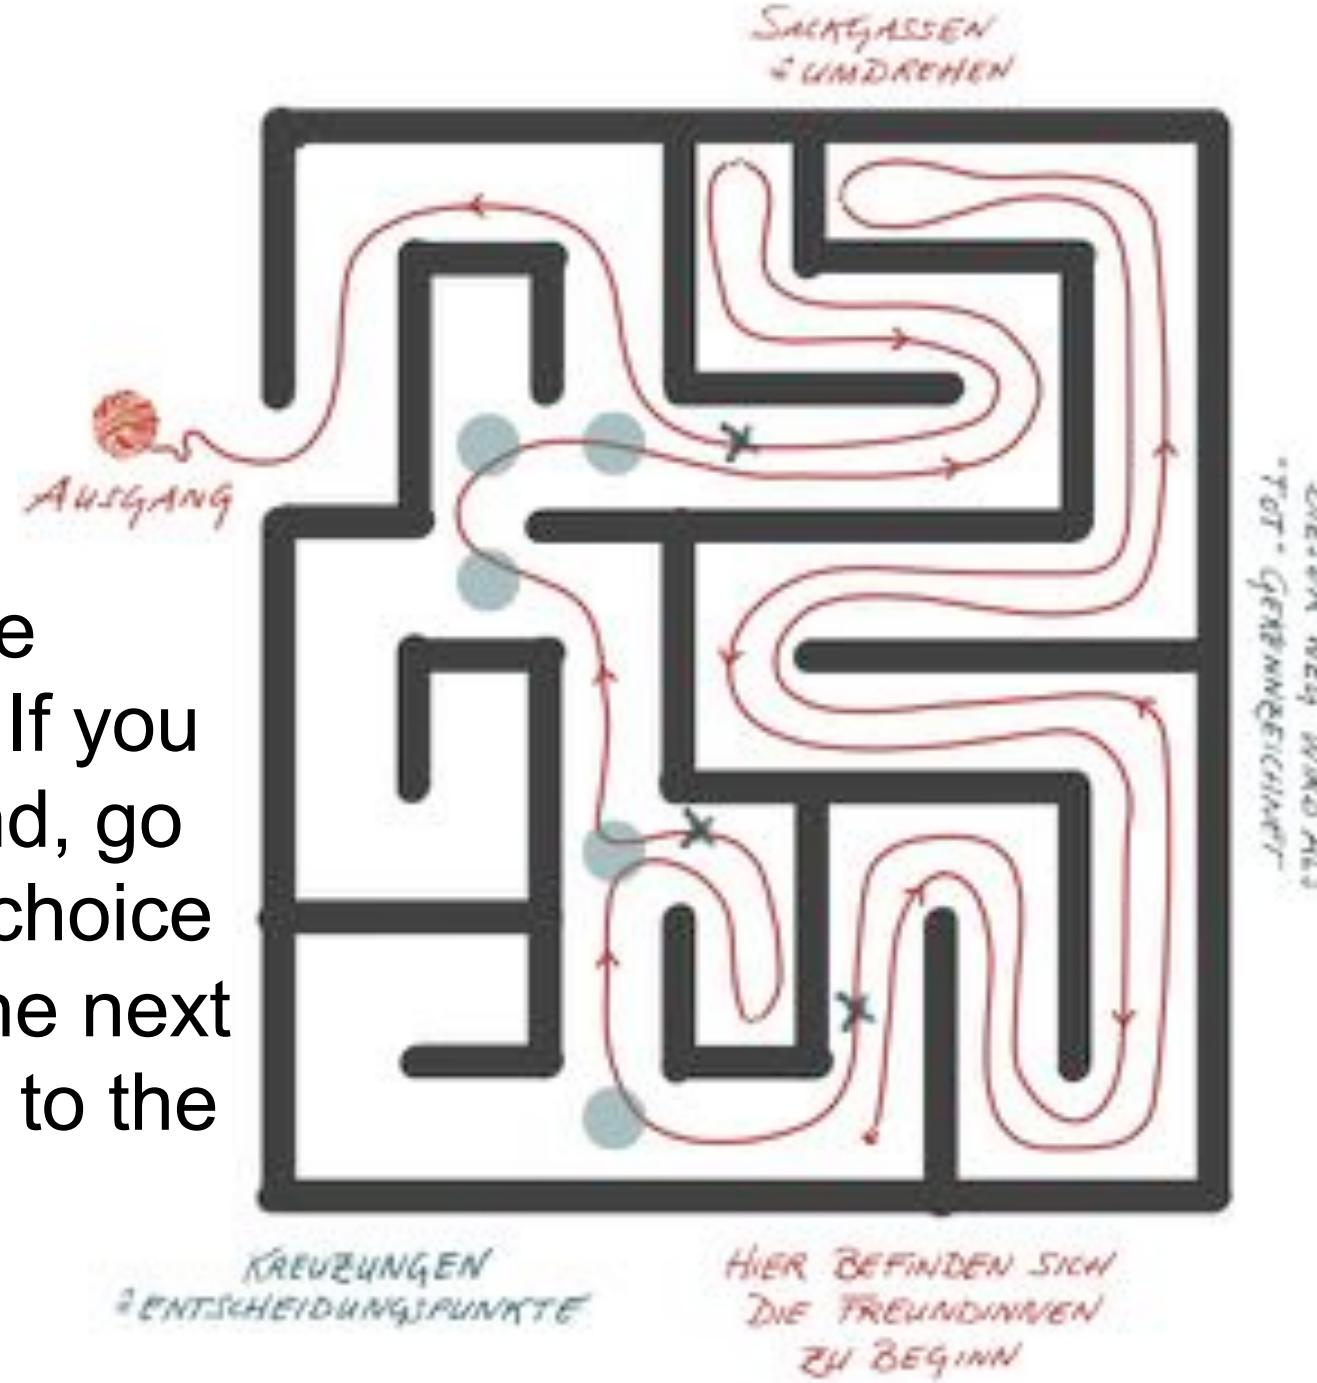

AI wants to build intelligent computer programs. How do we do this?

We use algorithms:
unambiguous specifications
of how to solve a class of
problems – in finite time.

Always follow the right-hand path. If you reach a dead-end, go back to the last choice point and take the next unexplored path to the right.

Think of it as a recipe!

A closer look at
the history of AI

ONCE
UPON A TIME

1956 Birth of AI

A Proposal for the
DARTMOUTH SUMMER RESEARCH PROJECT ON ARTIFICIAL INTELLIGENCE

We propose that a 2 month, 10 man study of artificial intelligence be carried out during the summer of 1956 at Dartmouth College in Hanover, New Hampshire. The study is to proceed on the basis of the conjecture that every aspect of learning or any other feature of intelligence can in principle be so precisely described that a machine can be made to simulate it. An attempt will be made to find how to make machines use language, form abstractions and concepts, solve kinds of problems now reserved for humans, and improve themselves. We think that a significant advance can be made in one or more of these problems if a carefully selected group of scientists work on it together for a summer.

Algorithms of intelligent behaviour teach us a lot about ourselves

The twin science: cognitive science

"How do we humans get so much from so little?" and by that I mean how do we acquire our understanding of the world given what is clearly by today's engineering standards so little data, so little time, and so little energy.

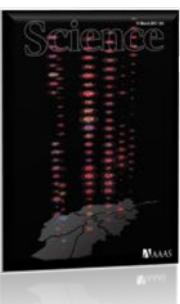

Centre for Cognitive Science at TU Darmstadt

Establishing cognitive science at the Technische Universität Darmstadt is a long-term commitment across multiple departments (see [Members](#) to get an impression on the interdisciplinary of the supporting groups and departments). The TU offers a strong foundation including several established top engineering groups in Germany, a prominent computer science department (which is among the top four in Germany), a

Computational

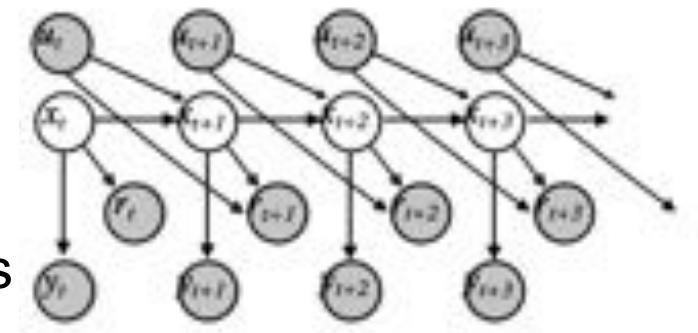

Why do things work the way they work? What is the goal of the computation? What are the unifying principles?

maximize:

$$R_t = r_{t+1} + r_{t+2} + \cdots + r_T$$

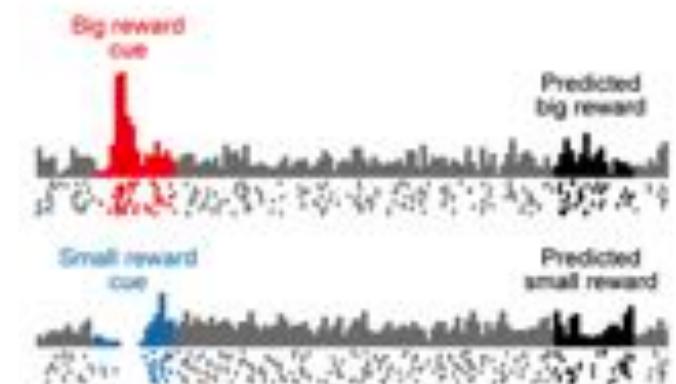

Algorithmic

What representation can implement such computations? How does the choice of the representation determine the algorithm

Implementational

How can such a system be built in hardware?
How can neurons carry out the computations?

slide after C. Rothkopf (TUD)

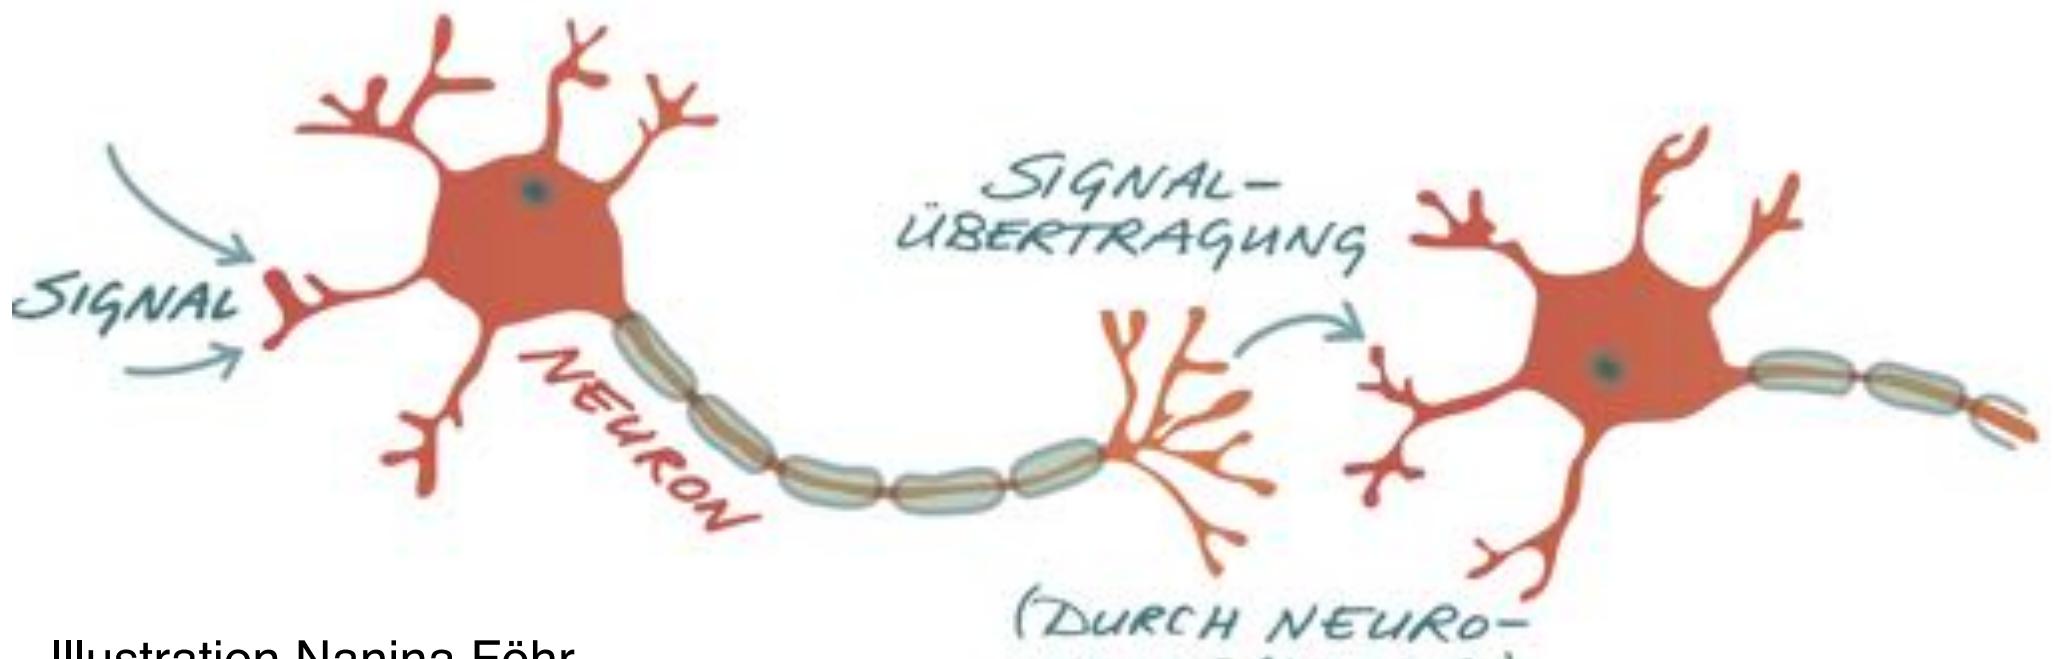

Artificial Neural Networks

Inspiration from the brain:

- many small interconnected units (neurons)
- learning happens by changing the strength of connections (synapses)
- behavior of the whole is more than the sum of the parts

Frank
Rosenblatt
(1928-1971)

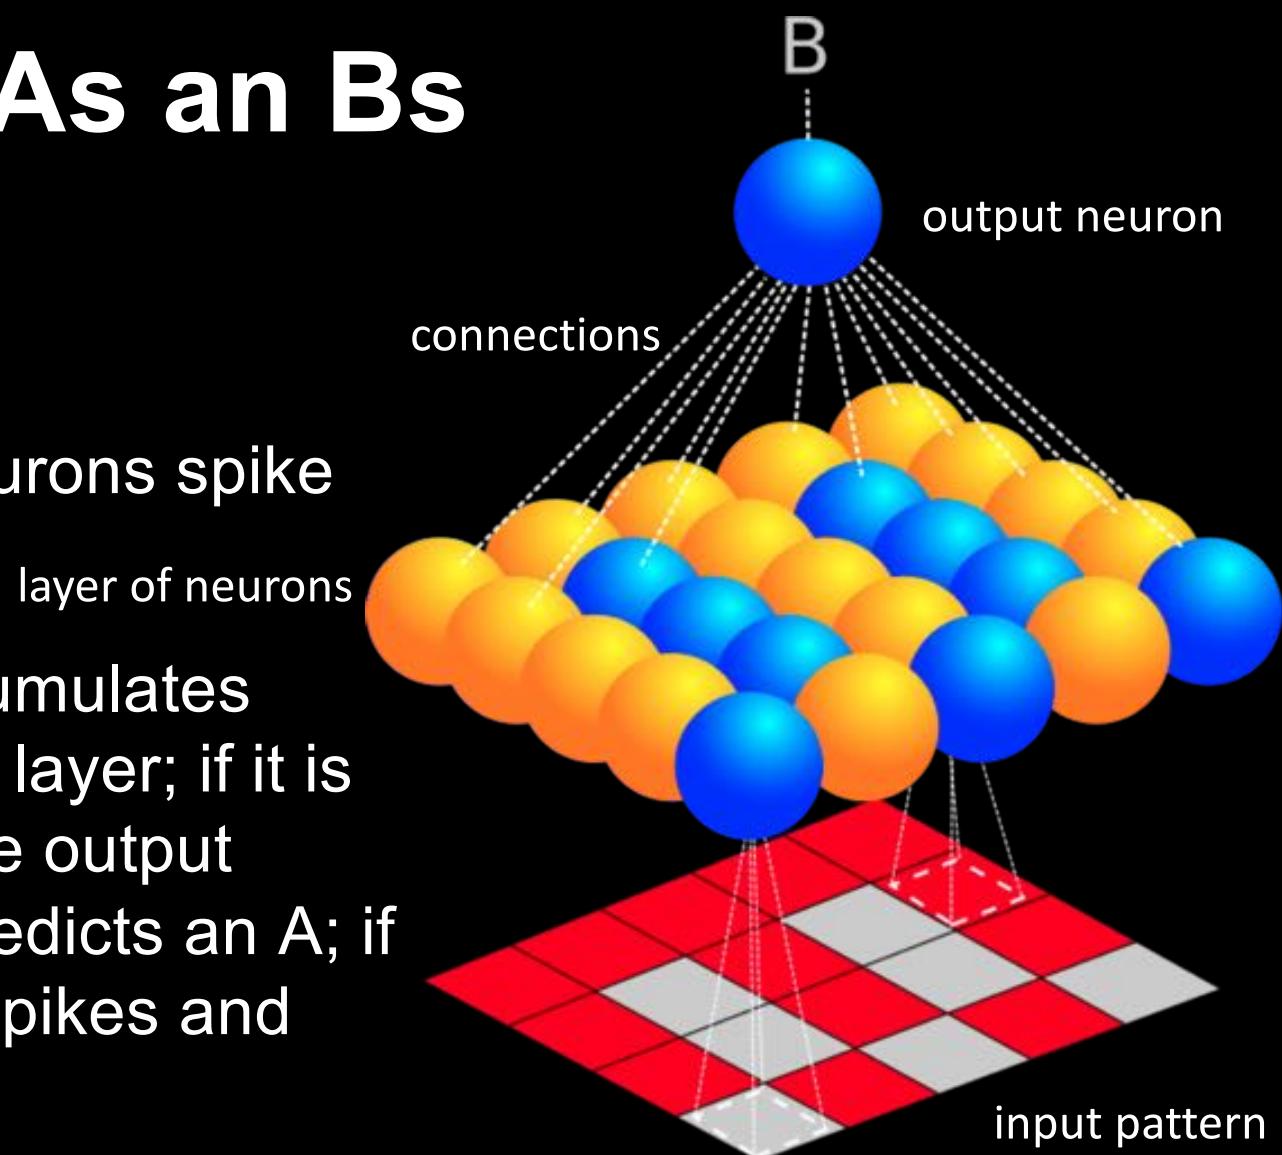

The Perceptron to distinguish As and Bs

1) present pattern

2) some first layer neurons spike

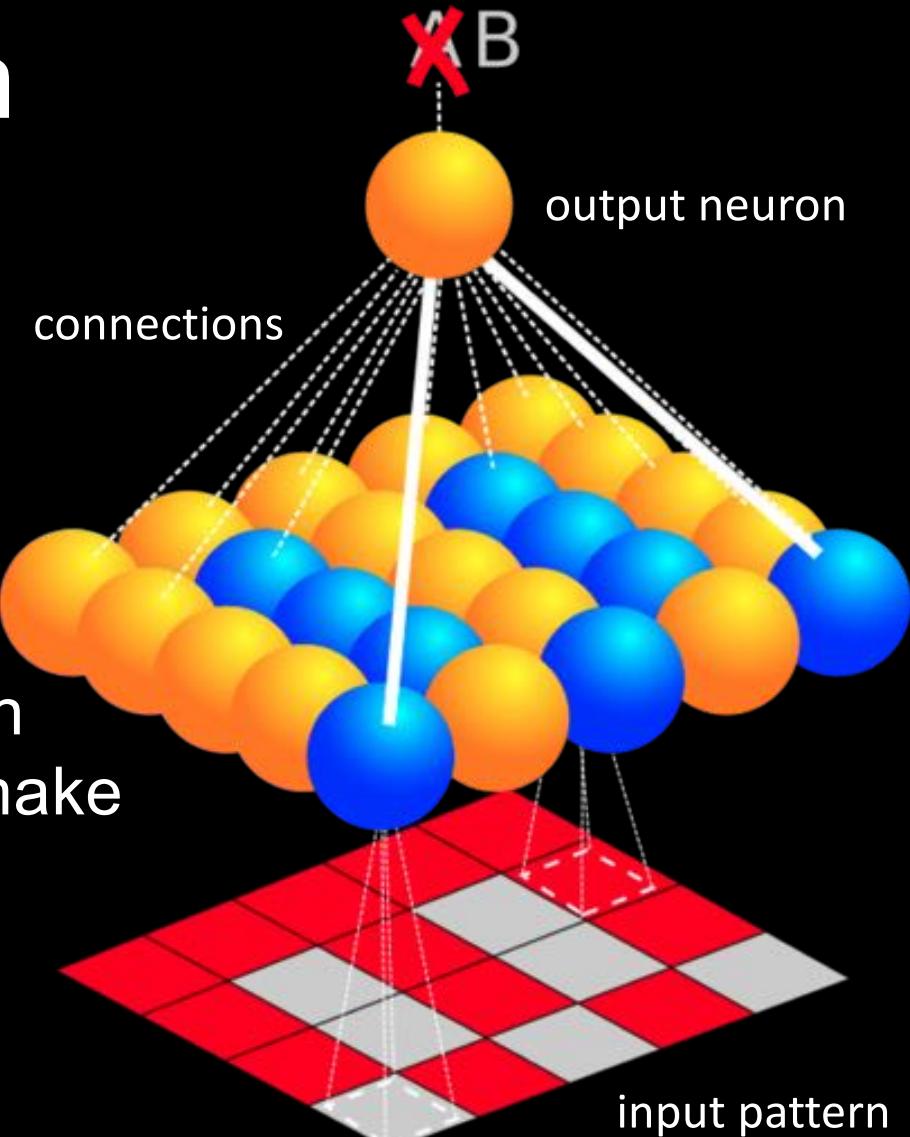

3) output neuron accumulates signals from previous layer; if it is above a threshold, the output neuron spikes and predicts an A; if not, then it does not spike and predicts a b

4) prediction is “B”

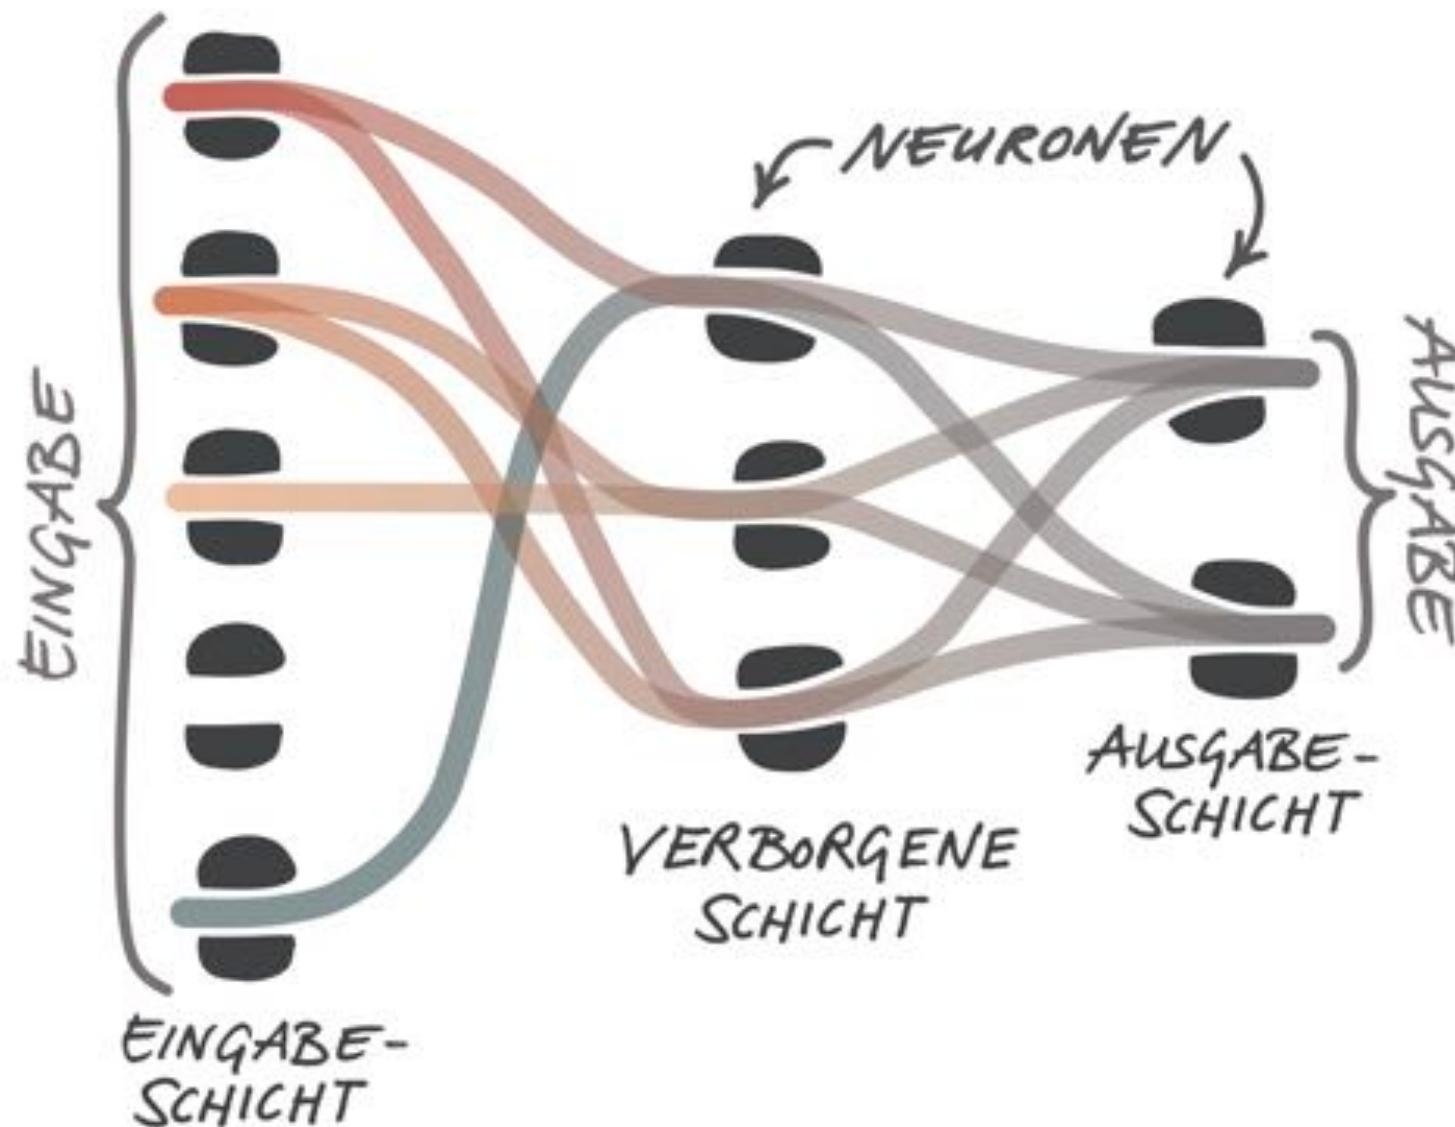

The Perceptron Learning Algorithm

- 1) present pattern
- 2) wait for output to be produced
- 3) if output correct
 - change nothing
- 4) if output incorrect:
 - adjust connection strength (positive or negative) to make the pattern be classified correctly
- 5) repeat until no more errors

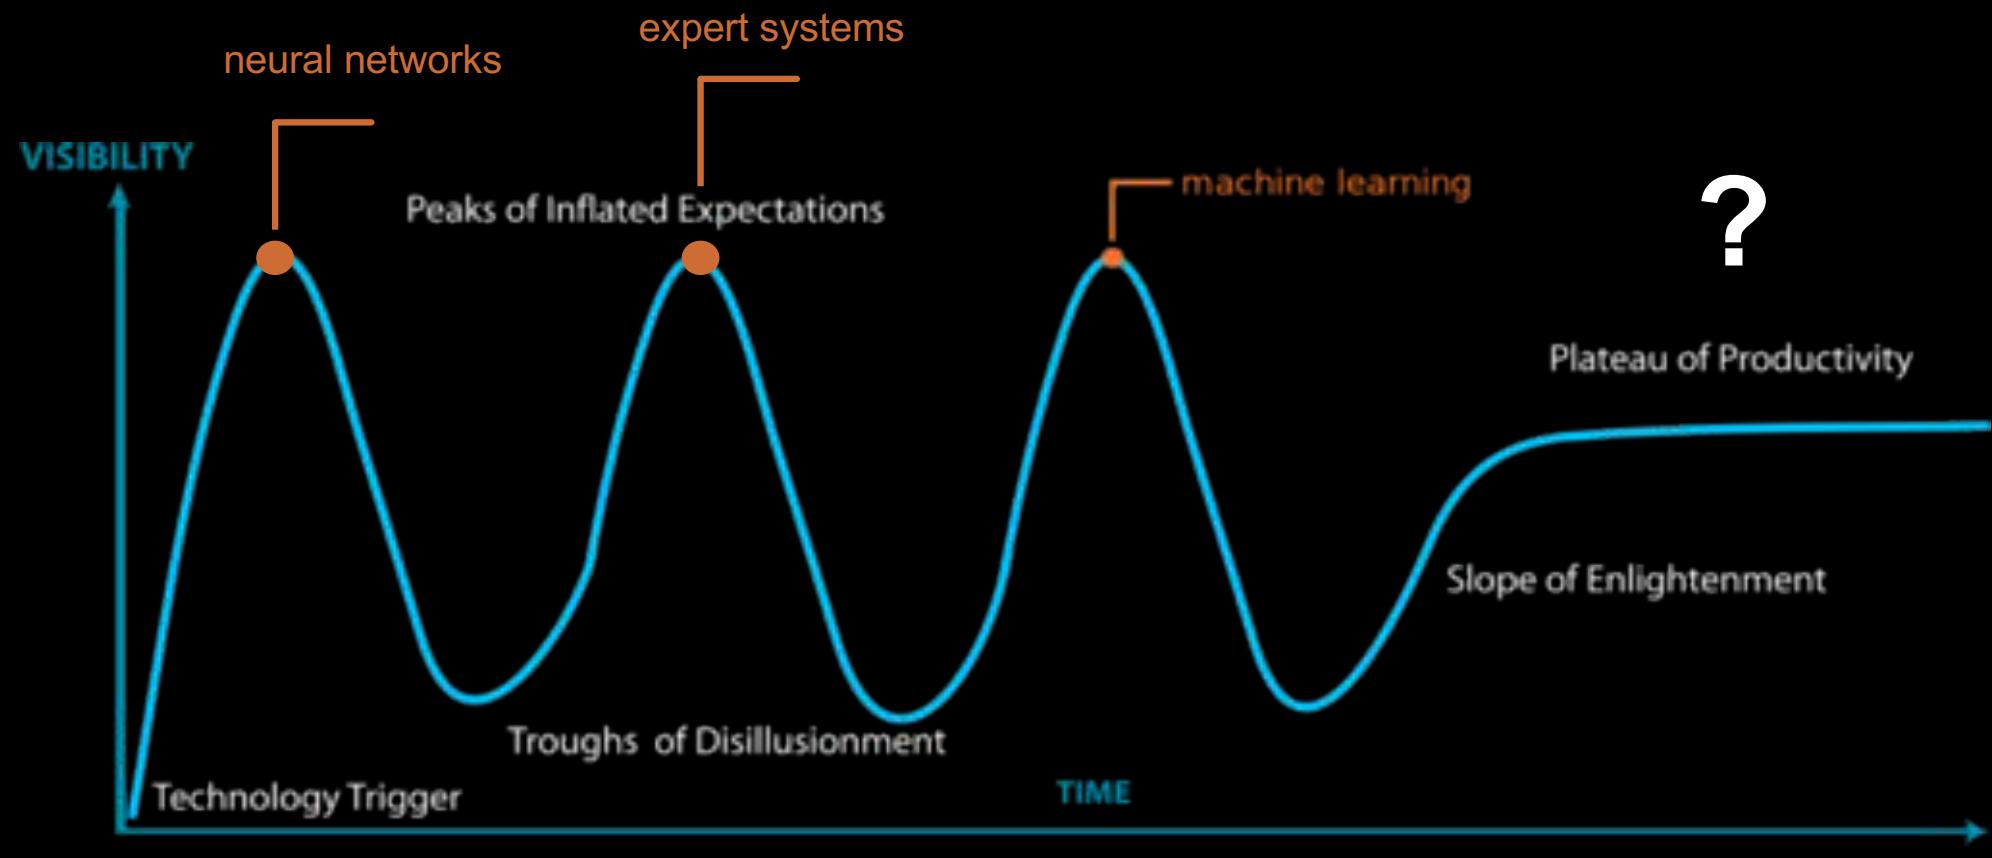

Artificial Neural Networks

= Stacking of many artificial neurons

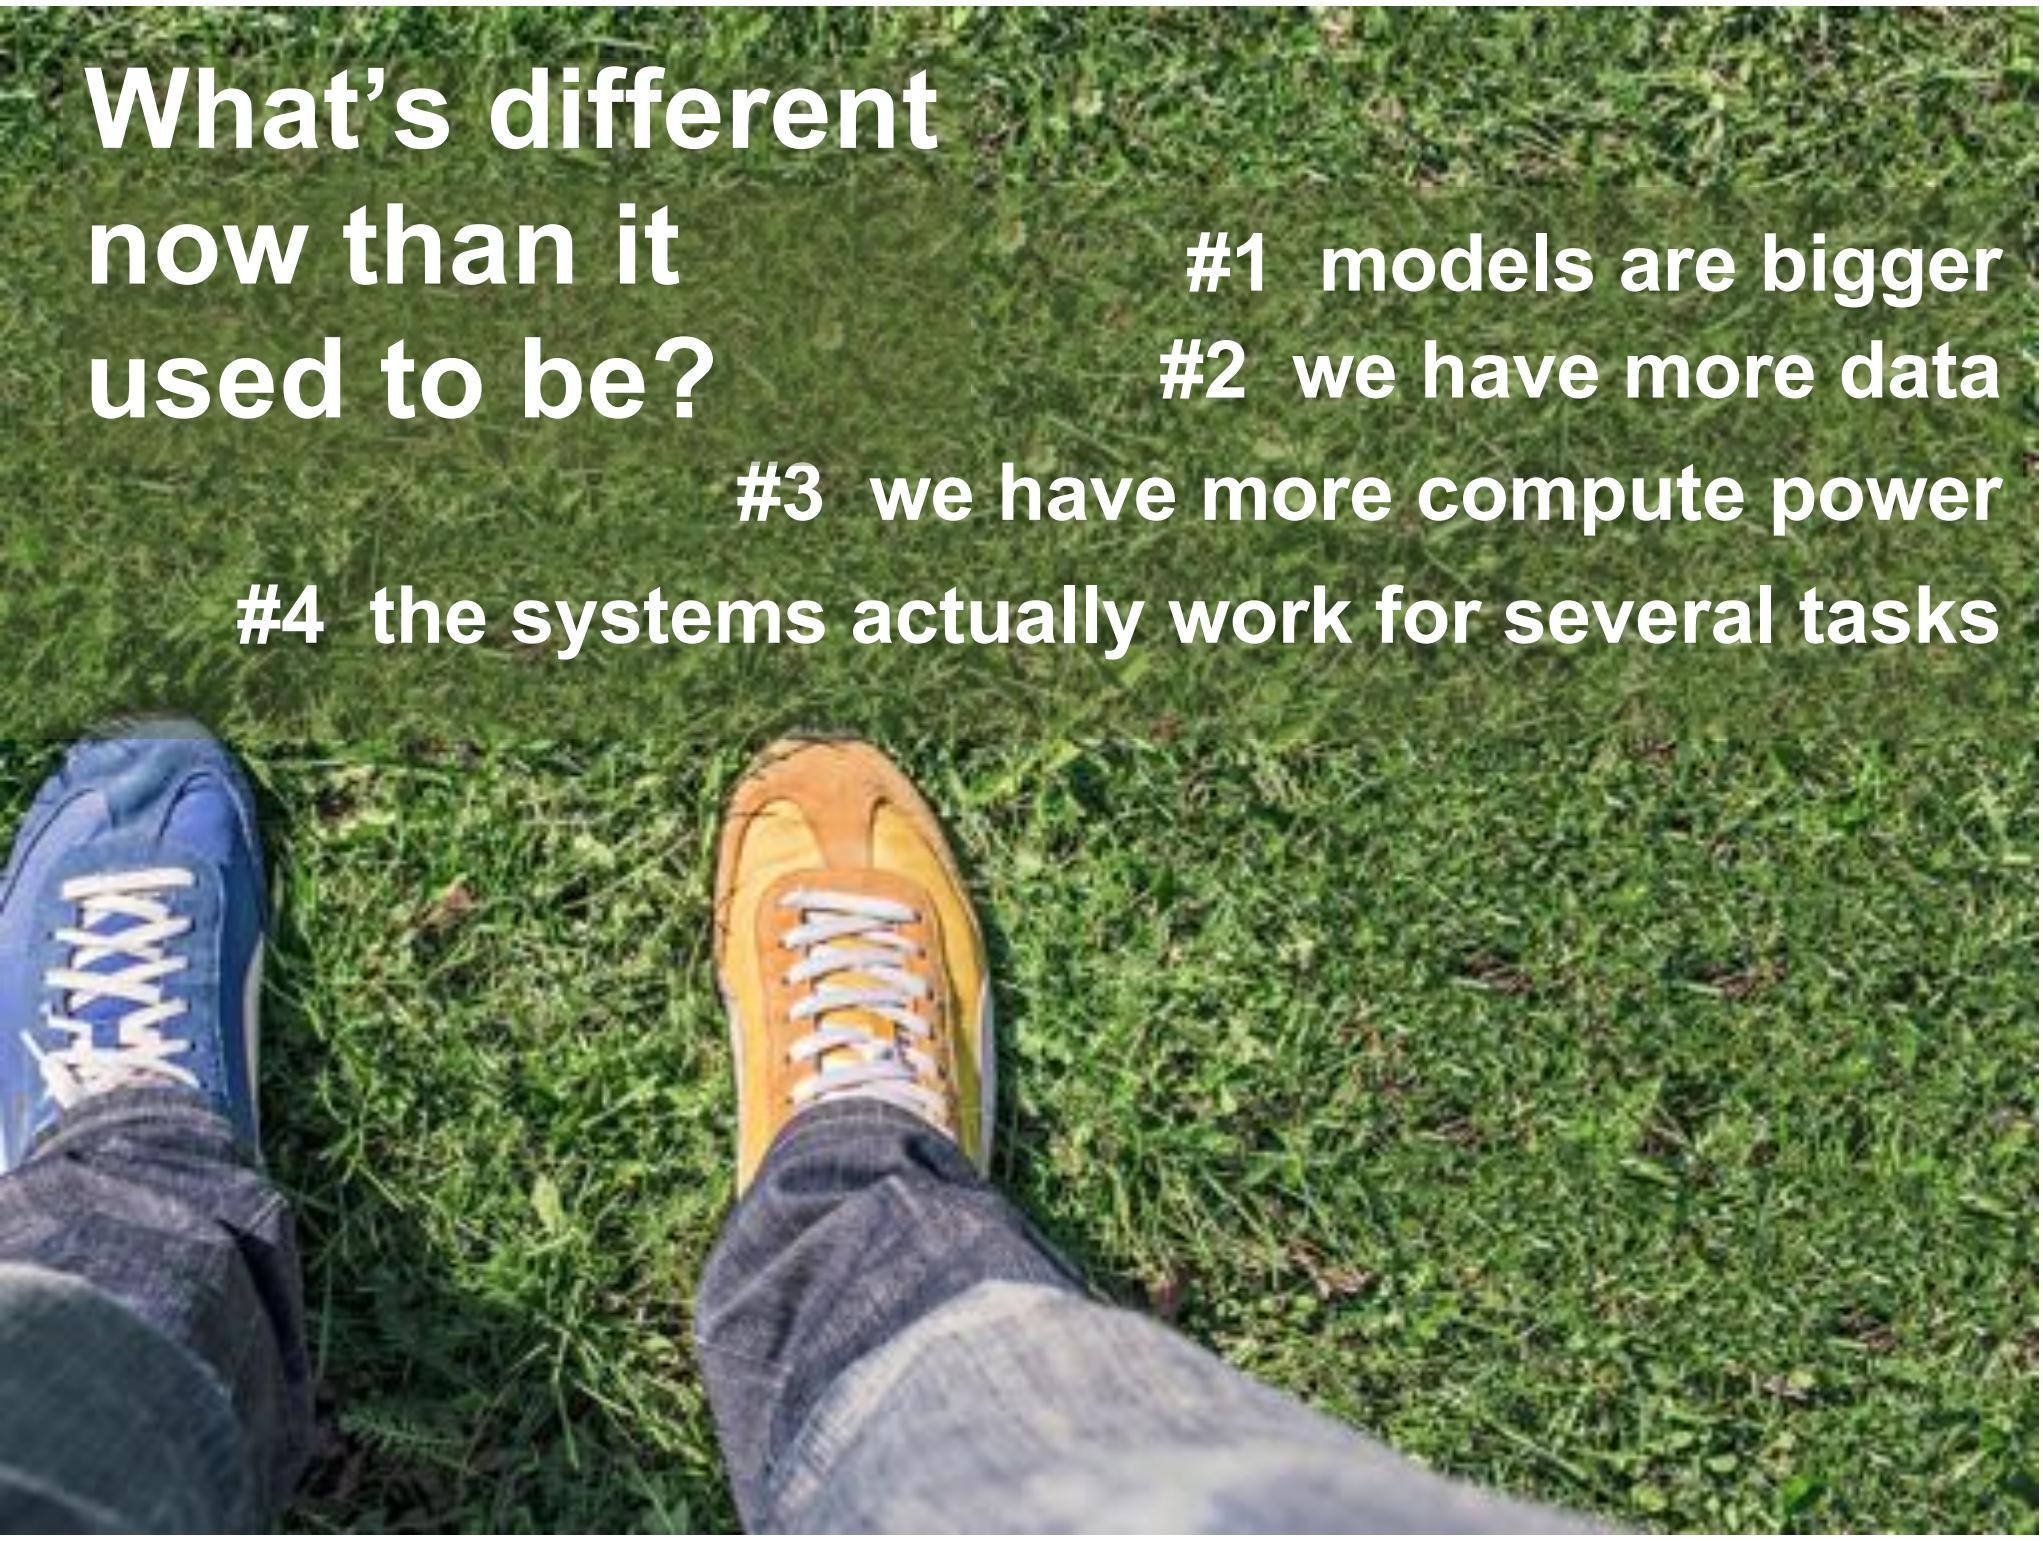

The history of AI in a nutshell

1956

2019

A photograph showing a person's lower legs and feet resting on a green grassy slope. The person is wearing blue jeans and two different colored sneakers: a blue one on the left and an orange one on the right. The background is a lush green hillside.

What's different
now than it
used to be?

#1 models are bigger

#2 we have more data

#3 we have more compute power

#4 the systems actually work for several tasks

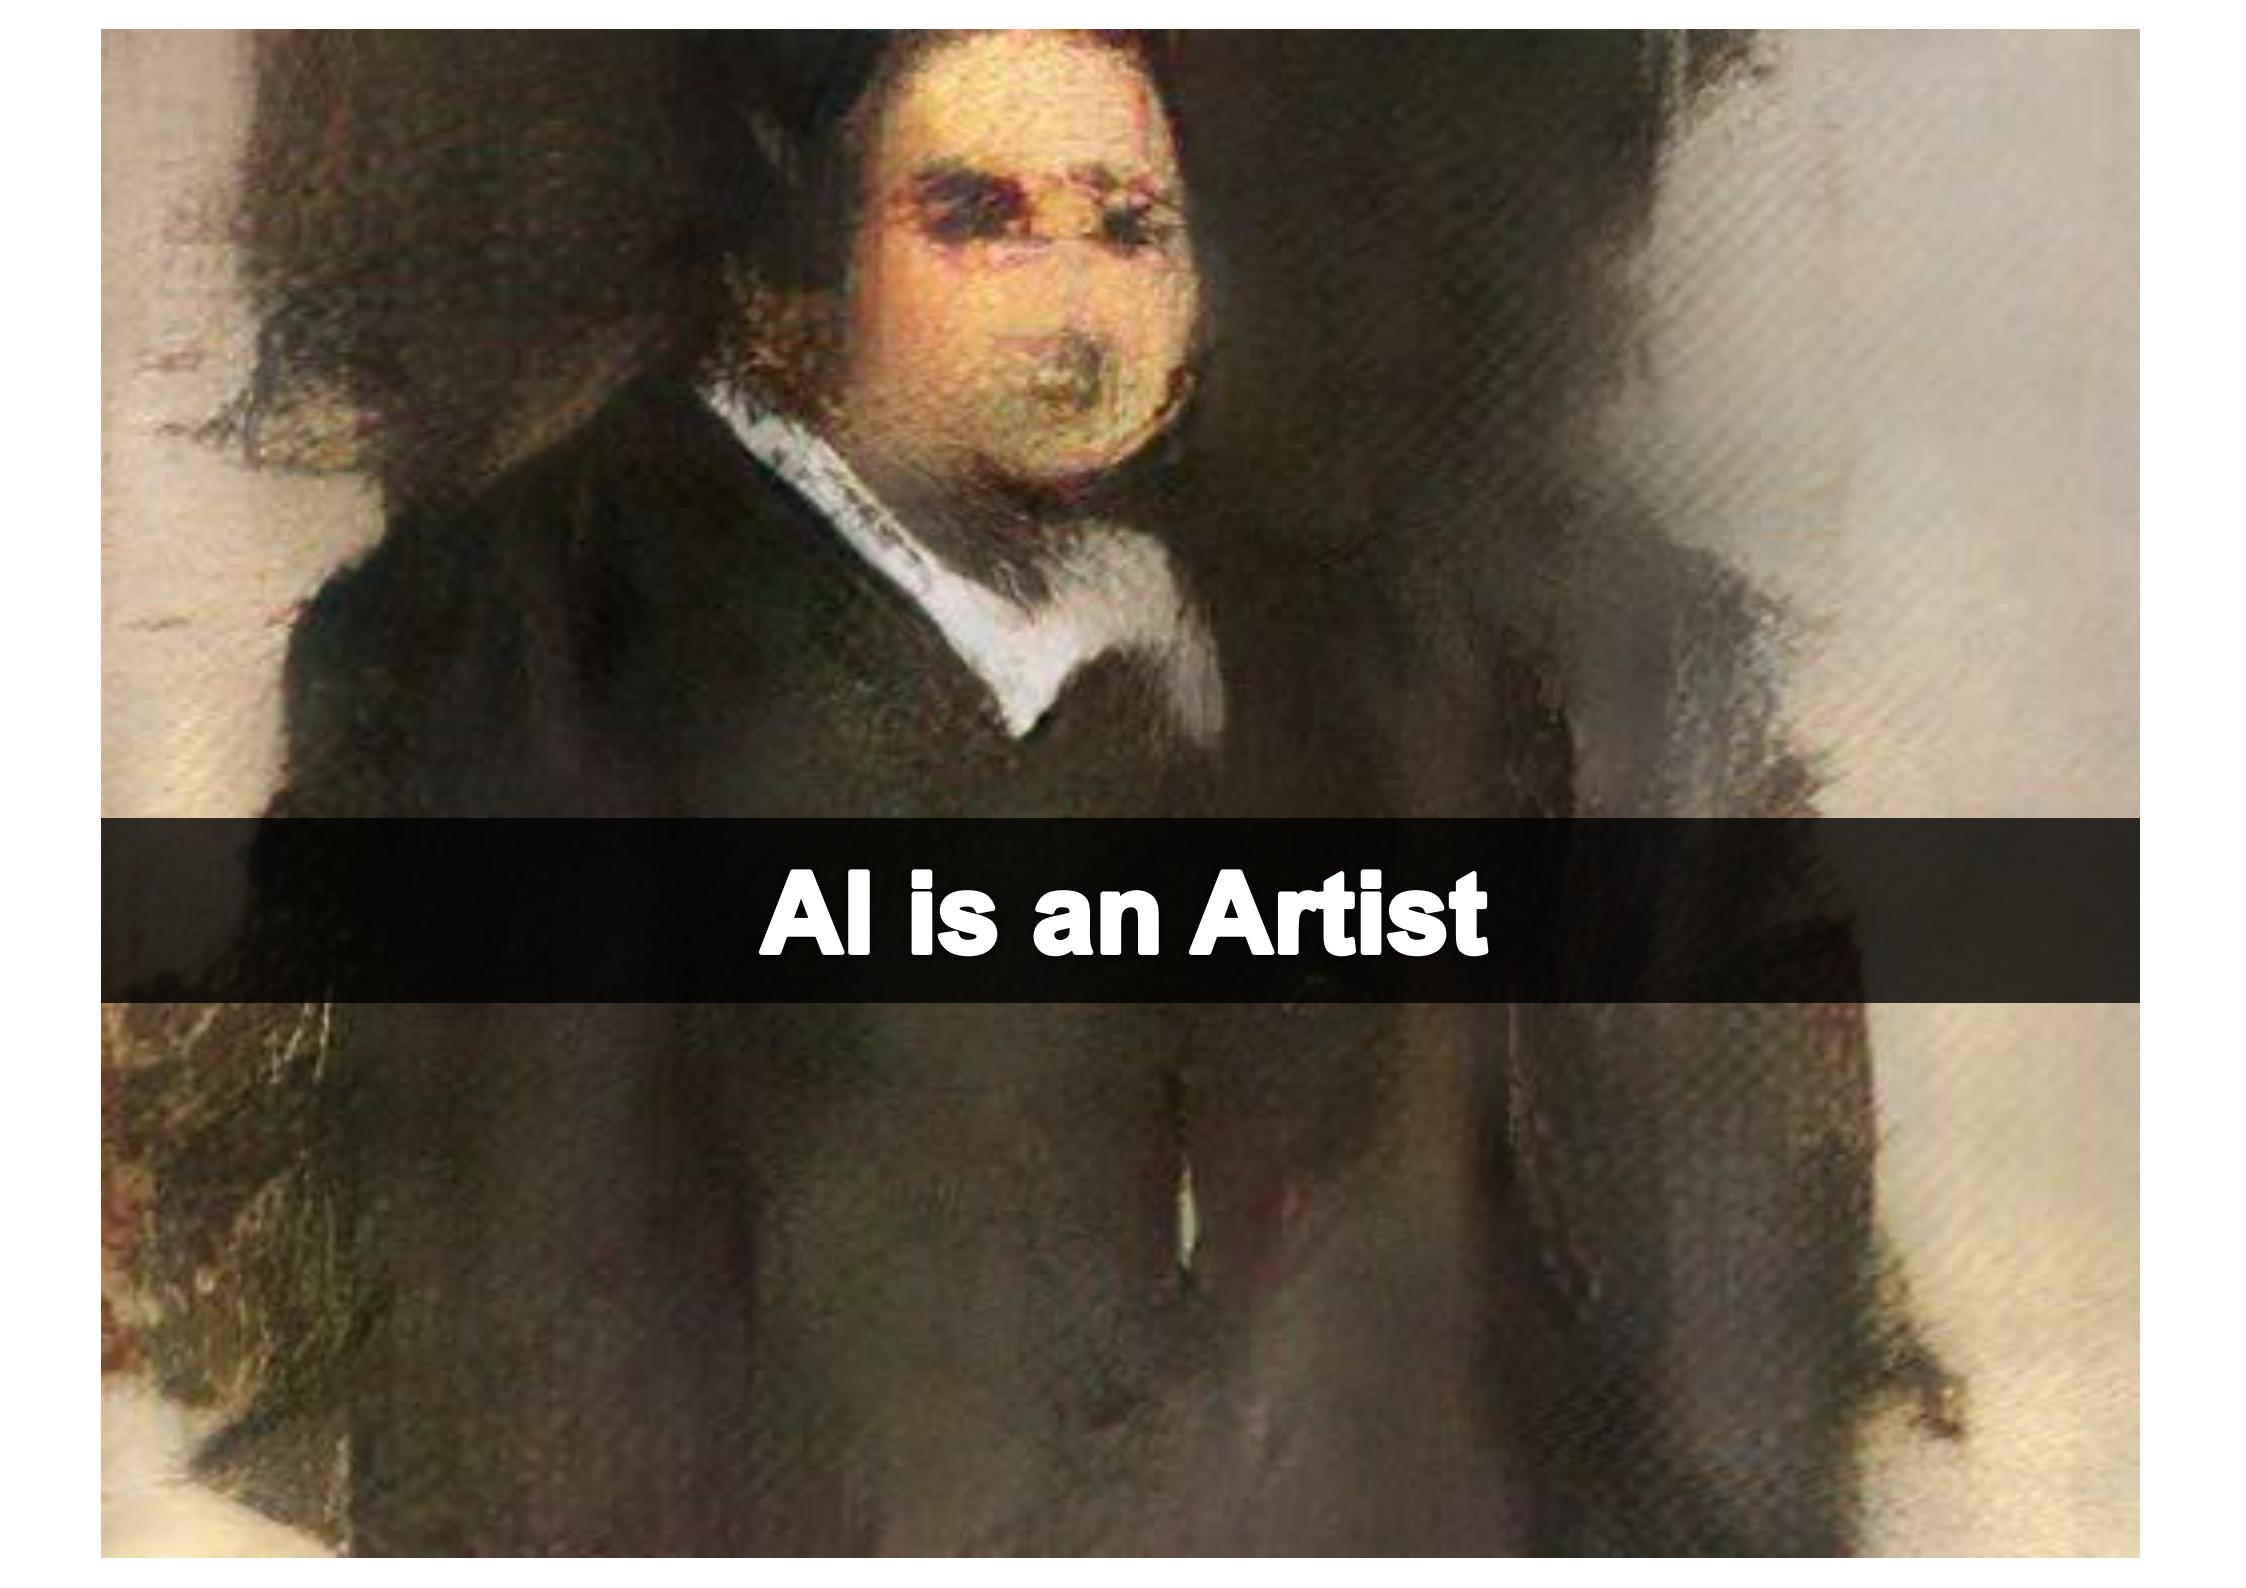

A photograph of a robotic arm, likely a Universal Robots model, performing laundry tasks. The arm is white and mounted on a grey base. It is positioned over a green surface where several pieces of laundry are laid out. The background shows a domestic setting with a wooden cabinet and a red cloth. A black rectangular overlay contains the text.

**AI does the
laundry**

AI drives cars

A painting of a man in a dark suit and a patterned tie, looking slightly to the right. The background is a textured, light-colored wall.

AI is an Artist

Schachmatt durch „CrazyAra“

Künstliche Intelligenz schlägt mehrfachen Weltmeister im Einsetzschach

Der von den TU-Studierenden Johannes Czech, Moritz Willig und Alena Beyer entwickelte Bot „CrazyAra“ hat den Schachprofi Justin Tan in einem Online-Match der Schach-Variante „Crazyhouse“ mit 4:1 geschlagen. Gelernt hat der Bot mittels künstlicher neuronaler Netze, was ihm erlaubt, vorausschauend Entscheidungen zu treffen. Das Besondere: Die Studierenden konnten damit einen Erfolg auf einem Feld feiern, das sonst von Giganten wie Google dominiert wird.

My team and I in the **Machine Learning** lab together with our colleagues at the Centre for Cognitive Science would like to make computers learn so much about the world, so rapidly and flexibly, as humans.

- 2017 - now: Professor (W3) for Machine Learning at the CS Department of the TU Darmstadt, Germany
2013 - 2017: Associate Professor (W2) for Data Mining at the CS Department of the TU Dortmund University, Germany
2012 - 2013: Assistant Professor (W1) for Spatio-Temporal Pattern in Agriculture at the Faculty of Agriculture of the University of Bonn, Germany
2008 - 2012: Fraunhofer Attract research group leader at the Fraunhofer IAIS, Germany
2007: PostDoctoral Associate at MIT CSAIL, USA, working with Leslie Kaelbling, Josh Tenenbaum, and Nicholas Roy.
2000 - 2006: Ph.D. student at the CS Department of the University of Freiburg, Germany, working with Luc De Raedt (supervisor) and Wolfram Burgard.
1996 - 2000: Diploma in Computer Science at the CS Department of the University of Freiburg, Germany

Many neural networks have no probabilistic semantics. They are not calibrated joint distributions.

$$P(Y|X) \neq P(Y,X)$$
